Immunoglobulic-derived binding molecules that do not activate complement or trigger cytotoxic activities and maintaining desirable immunoglobulin properties.

Claim 12; Fig 17; 81pp; English.

This sequence represents the mutated CH2 molecule Gideltaab, and is a binding molecule of the invention. The recombinant binding molecule is capable of binding a target molecule without triggering complement dependent lysis, or the cell-mediated destruction of the target comprises: (a) a binding domain capable of binding a target molecule; and (b) an effector domain that is homologous to all or part of a constant

```
domain of a human immunoglobulin G (1gG) heavy chain. The binding molecule is used to bind a target molecule (especially FegammaRIIb causing inhibition of B cell activation, mast cell degranulation or phagocytosis). The binding molecule can be used to prevent or inhibit the binding molecule e.g. an antibody, to the target molecule. The binding molecule e.g. an antibody, to the target molecule. The binding molecule is useful for the treatment of graft-vs-nost disease, organ transplant rejection, bone-marrow transplant rejection, autoimmune haromotytopaenia and arthritis) alloimmune haromotytopaenia and arthritis, alloimmunity (e.g. troinic or acute inflammatory diseases (e.g. Crohn's, HDN chroblasticosis focetalls), Goodpastures, sickle cell anaemia and coronary artery occlusion). The binding molecules do not activate complement or trigger cytotoxic activities through FegammaR and desirable ing properties have been retained. The polypeptides do not contain nonlumnan amino acide, and are therefore likely to have reduced immunogenicity. Further, they still bind Protein A, which is consistent through interaction with FCRn contains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           (neonatal Fc receptor)

```
polypeptide ligated at the C-terminus with a portion of an immunoglobulin [19] comprising a hinge region and a constant domain of a mammalian Ig heavy chain. The polypeptide comprises a tailpiece from the C-terminus of the heavy chain of an IgA or IgM antibody. Polypeptides of the invention is useful for preparing a composition for treating or preventing human are useful for preparing a composition for treating or preventing human therapy and also in the preparation of vaccines. The present sequence is a fusion protein variant (G218P/L219V/220delA/G221A) which comprises a fusion protein is also referred to as mutant region. This variant protein is also referred to as mutant F

                           A chimeric antibody (AAW14933) comprises the C1 and hinge regions of human 1gG2 and the C2 and C3 regions of human 1gG4 (G2/G4 MAb) and a murine anti-porcine soluble vascular cell adhesion molecule (VCAM) monoclonal antibody (WAAD) 2A2 heavy chain variable region sequence also AAW14932). The chimeric antibody is specific for porcine VCAM. It is useful for diagnosing human rejection of porcine exentransplants and for improving xenotransplants on of porcine cells, tissues and for human recipients. The chimeric antibody is specific for porcine VCAM. It is useful for diagnosing human rejection of porcine exenctransplants and for improving xenotransplants of porcine cells, tissues and organs into human recipients. (Updated on 17-OCT-2003 to standardise OS field)
useful for diagnosing human rejection of porcine xenotransplants and for improving xenotransplantation of porcine cells, tissues and organs into human recipients. (Updated on 17-OCT-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Matis LA;

The chimeric antibody is specific for porcine VCAM. It is useful for diagnosing human rejection of porcine exentransplants and for improving xenotransplants and for confinence (Updated on 17-OCT-2003 to standardise OS field)

The present into present the complementary determining region (DR) are present of the complementary determining region (CDR) are least a portion of the complementary determining region (CDR) are replaced or fused with biologically active peptides e.g. a peptide complementary determining region (CDR) are minetic such as an erythropoletin (EPO) or thrombopoietin (TPO) mimetic, that is flanked with proline at its carboxy terminus. (I) has antianaemic, haemostatic and nephrotropic activities, and can be used as a stimulator of proliferation, differentiation and maturation of the amentopoletic cells, and a stimulator of haematopolesis. (I) is useful for stimulating proliferation, differentiation or growth of promegakaryocytes or megakaryocytes, where (I) is contacted with complements or megakaryocytes, where (I) is contacted with production. (I) with a region where amino acid residues corresponding to production of CDRs fused to an EPO mimetic, or which has one or component of its CDRs fused to an EPO mimetic, is useful for increasing the production of red blood cells, where (I) is contacted with haematopoietic content of the progenitors. (I) is useful for increasing the content of the progenitors (I) is useful for diagnostics or therapeutics, in cell isolation strategies, and for treating patients or appression of haematopoietic contents related to the suppression of haematopoiesis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ABQ73288 to ABQ73377 and ABP51669 to ABP51696 represent sequences used in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention describes an immunoglobin molecule or its fragment

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a novel immunoglobulin molecule or its fragment comprising a region where amino acid residues corresponding to at least a portion of a two complementarity determining regions (CDR8) are replaced with a peptide mimetic selected from an erythropoietin (EPO) mimetic and a thrombopoietin (TPO) mimetic. An immunoglobulin molecule of the invention has immunoglobulin molecule is useful for diagnosing or treating thrombocytopenia as a result of chemotherapy. The immunoglobulin molecule is useful for diagnosing or treating thrombocytopenia as a result of chemotherapy, bone marrow transplantation, or chronic diseases such as idiopathic thrombocytopenia. The present sequence represents an immunoglobulin antibody heavy chain of
immunoglobulin; complementarity determining region; CDR; peptide mimetic; erythropoietin; EPO; thrombopoietin; TPO; immunosuppressive; immunotherapy; thrombocytopenia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       316
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New immunoglobulin molecule comprising a region, where two complementarity determining regions (CDRs) are replaced with BPO mimetic or a TPO mimetic, useful for treating thrombocytopenia.

This sequence represents the constant region of a human anti-Vascular Adhesion Protein-1 (VAP-1) antibody heavy chain. This sequence may be used in the production of a chimeric mouse-human anti-VAP-1 antibody. The nucleic acid molecules, polypeptides or antibodies are useful in treating VAP-1 mediated inflammatory disorders, such as rheumatoid arthritis, inflammatory bowel disease, autoimmune diseases or psoriasis. The chimeric VAP-1 antibody is further used for in viro and in vivo diagnostic applications, including in vivo immunoscintigraphic imaging of inflammation sites. The chimeric MAD's of the invention have improved kinetic properties compared to the corresponding murine antibodies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New chimeric anti-Vascular Adhesion Protein-1 monoclonal antibodies and encoding nucleic acid molecules, useful for diagnosing and treating chronic inflammatory disorders, e.g. rheumatoid arthritis or psoriasis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      111 APPVAGPSVFLFPPKPKDTLMISRTPEVTCVVVDVSHEDPEVQFNWYVDGVEVHNAKTKP

New anti-nerve growth factor antibodies for preventing or treating pain, including post-surgical pain, rheumatoid arthritis pain or osteoarthritis pain, or for treating inflammatory cachexia associated with rheumatoid

Claim 25; SEQ ID NO 16; 186pp; English.

The invention relates to a novel anti-nerve growth factor (NGF) antibody which binds NGF with a KD of less than about 2 nM and inhibits human NGF-dependent survival of mouse E13.5 trigeminal neurones with an ICSO of about 100 or 10 pM or less, where the ICSO is measured in the presence of about 15 or 1.5 pM of human NGF. The antibody of the invention demonstrates analgesic and immunomodulator activities and may be useful for preventing and/or treating pain, including post-surgical pain and pain associated with rheumatoid arthritis or osteoarthritis. The antibody may be further utilised for treating inflammatory cachexia associated with rheumatoid arthritis, as well as during gene therapy procedures. The current sequence is that of the humanised antibody E3 heavy chain full-length protein of the invention which was synthesised via

Sequence 462 AA

This sequence may be used in the production of a chimeric mouse-human anti-VAP-1 antibody. The nucleic acid molecules, polypeptides or antibodies are useful in treating VAP-1 mediated inflammatory disorders, such as rheumatoid arthritis, inflammatory bowel disease, autoimmune diseases or psoriasis. The chimeric VAP-1 antibody is further used for in vitro and in vivo diagnostic applications, including in vivo immunoscintigraphic imaging of inflammation sites. The chimeric MAD's of the invention have improved kinetic properties compared to the corresponding murine antibodies.
                                                                                                                                                                                                                   232 APPVAGPSVFLFPPKPKDTLMISRTPBVTCVVVDVSHEDPBVQFNWYVDGVEVHNAKTKP 291

The recombinant binding molecule is capable of binding a target molecule without triggering complement dependent lysis, or the cell-mediated destruction of the target comprises: (a) a binding domain capable of binding a target molecule; and (b) an effector domain that is homologous to all or part of a constant domain of a human immunoglobulin (G (IgG) heavy chain. The binding molecule is used to bind a target molecule (especially FcgammaRID molecule is used to bind a target molecule (especially FcgammaRID molecule is used to binding molecule can be used to prevent or inhibit the binding molecule can be used to prevent or inhibit the binding molecule can be used to prevent or inhibit can of a second binding molecule can be used to prevent or inhibit the binding molecule is useful for the treatment of graft-vs-coluctule. The binding molecule is useful for the treatment of graft-vs-coluction, autoimmune transplant rejection, bone-marrow transplant rejection, autoimmune hamolytic anaemia, contoinmune thrombocytopaenia, and arthritis), alloimmune thrombocytopaenia, act asthma and allergy), chronic or acute inflammatory diseases (e.g. Crohn's, HDN cerythroblastosis foetalis), Goodpastures, sickle cell anaemia and

coronary artery occlusion). The binding molecules do not activate complement or trigger cytotoxic activities through PcgammaR and desirable IgG properties have been retained. The polypeptides do not contain non-uman amino acids, and are therefore likely to have reduced immunogenicity. Further, they still bind Protein A, which is consistent with being able to cross the human placenta through interaction with FCRn (neonatal FC receptor)
                                                                                                                                                                                                                                                                                                                                                                   59

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          SUNB/)
```

The invention relates to a recombinant human erythropoietin (HuEPO) -L-vFC fusion protein comprising HuEPO, a peptide linker, and a human CC fusion protein Comprising HuEPO, a peptide linker, and a human cC immunoglobulin GFC (fragment crystallisation reggion) variant. Also included is a carbohydrate-derived cell line producing the human ccreates of 10 microgramme per million cells in a 24-hour period. The HuEPO c excess of 10 microgramme per million cells in a 24-hour period. The HuEPO c excess of 10 microgramme per million cells in a 24-hour period. The HuEPO c of at least 2-fold relative to that of recombinant HuEPO on a molar comprise the period linker containing about 20 or fewer amino cacids is present between HuEPO and the human IGG FC variant. The IGG FC contains amino acid mutations to attenuate effector functions. The human IGG with comprises a hinge, CH2 and CH3 domains of human IGG with CFC variant comprises a hinge, CH2 and CH3 domains of human IGG with CFC variant comprises a hinge, CH2 and CH3 domains of human IGG with CFC contains amino acid mutations, human IGG with Ser228Pro and Leu235Ala mutations, or human IGG1 with Leu234Val, Leu235Ala and Pro331Ser mutations. The CFC cecombinant human erythropoietin-L-vFC fusion protein in treating patients with chronic anaemia caused by renal failure, cancer crecombinant human erythropoietin-L-vFC fusion protein in the serum, as compared to prior art, leads to lower dosages and less frequent injections result in better patient compliance and quality, of life. The concentrations means improved safety and tolerability, and less frequent injections result in better patient compliance and quality of life. The present sequence represents the fusion protein HUEPO-L-vFCgamma2. Claim 3; Fig 2A; 14pp; English

WPI; 2004-634851/61. N-PSDB; ADR48983 New recombinant HuEPO-L-vFc fusion protein comprises human erythropoietin (HuEPO), a peptide linker, and a human IgG Fc variant, useful for treating chronic anemia due to renal diseases, cancer chemotherapy, or rheumatoid arthritis.

Claim 3; SEQ ID NO 18; 31pp; English.

A recombinant HuBPO-L-vFc fusion protein comprises human erythropoietin (HuBPO).

Charles a peptide linker, and a human 1gG Fc variant, is new.

INDEPROBRY CLAMAS are also included for the following: a chinese hammer over yet (CO)-derived cell line producing the HuBPO-L-vFc fusion protein in the peptide linker, and a human 1gG Fc variant. Preferred protein: The peptide linker, and a human 1gG Fc variant. Preferred protein: The peptide linker containing 20 or fewer amino acids is present mino acids selected from glycine, estine, alanine, and threonine. The muman 1gG Fc variant, and Comprises two or more amino acids selected from glycine, estine, alanine, and threonine. The muman 1gG Fc variant comprises a hinge, CH3, and CH3 domains of human 1gG with Pro313Ear mutations comprising 437 amino acids (SBQ ID NO. 18).

CC comprises a hinge, CH2, and CH3 domains of human 1gG with leads activity similar too higger than the of fruge on a molar cological activity similar too higger than that of fruge on a molar cological activity similar too higger than that of fruge on a molar cological activity similar too higger than that of fruge on a molar cological activity similar too higger than that of fruge on a molar cological activity similar too higger than that of fruge on a molar cological activity similar too higger than that of fruge on a molar cological activity similar too higger than the of fruge on a molar contribute of the log Fc contains amino acid mutations to attended min nexcess of 30 kmicrosy ger million cells in a 24 hour period. The human 1gG Fc contains amino acid mutations to attended the functions, a flexible peptide linker companies a hinge, CH3.

CC To the log Fc contains amino acid mutations to attended the functions, a flexible peptide linker companies. The function and the human 1gG Fc variant comprises a hinge, CH3.

CC To the log Fc variant comprises a molar basis. Antiamented the free growth medium in excess of 10 kmicrosy general generating a cuttor of mutation or mycle of the cortain exhibits in For the convenience of cloning, SEQ ID NO. 1 which incorporates a restriction enzyme cleavage site is used as the 5' oligonucleotide primer. The 3' primer (SEQ ID NO. 2) eliminates the EPO termination codon and incorporates a BamHI site. The resulting DNA fragments of approximately 600 bp were inserted into a holding vector such as pUC19 at the HindIII and BamHI sites to give the DBPO plasmid. The sequence of the human EPO gene was confirmed by DNA sequencing.

stimulating factor (hG-CSF)-L-vFc fusion protein comprising hG-CSF, a
peptide linker, and a human immunoglobuling (IgG) Fc variant. Also
described are: a CHO-derived cell line producing the above hG-CSF-L-vFc
fusion protein in its growth medium in excess of 10 £mg/sg per million
cells in a 24-hour period; and making the recombinant fusion protein
cited above, comprising generating a CHO-derived cell line cited above,
growing the cell line under conditions the recombinant fusion protein is
expressed in its growth medium, and purifying the expressed protein. The
recombinant fusion protein is useful in treating a variety of conditions
associated with an impaired immune or haematopoietic system, including
cancer chemotherapy. leukaemias, anaemias, ALDS, bone marrow
transplantation, and chronic neutropenias. This is the amino acid
sequence of human GCSF-L-fragment of crystallisation gamma 2 variant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New recombinant human granulocyte colony-stimulating factor (hG-CSF)-L-vFc fusion protein for treating immune or hemaropoietic system disorders comprises hG-CSF, a flexible peptide linker, and a human immunoglobulin G Fc variant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  cytostatic; immunostimulant; antianaemic; anti-HIV; protein therapy; human; granulocyte colony-stimulating factor; GCSF; GCSF-L-vFc; immunoglobulin G; IgG; fragment of cryetallisation; immune disorder; haematopoietic disorder; cancer; chemotherapy; leukaemia; anaemia; AIDS; bone marrow transplantation; chronic neutropenia; fusion protein; fragment of crystallisation gamma 2; Fc gamma 2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 "Mature human GCSF-L-fragment of crystallisation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human GCSF-L-fragment of crystallisation gamma 2 fusion protein.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Patent No. 6737267
GENERAL INFORMATION:
APPLICANT: GTADAM P. Allaway et al.
TITLE OF INVENTION: AND USES THEREOF
FILE REFERENCE: 2048/41215-CB/JPW/SHS
CURRENT APPLICATION NUMBER: US/09/766,995
CURRENT FILING DATE: 2011-01-22
NUMBER OF SEQ ID NOS: 9
SOFTWARE: Patentin version 3.0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence 2, Application PC/TUS9307422
GENERAL INFORMATION:
APPLICANT: Progenics Pharmaceuticals, Inc.
TITLE OF INVENTION: ONN-PEPTIDYL MOIETY-CONJUGATED
TITLE OF INVENTION: CD4-GAMMA2 AND CD4-IgG2 IMMUNOCONJUGATES, AND USES THEREOF
NUMBER OF SEQUENCES: 9

Immunoglobulic-derived binding molecules that do not activate complement or trigger cytotoxic activities and maintaining desirable immunoglobulin properties.

Claim 12; Fig 17; 81pp; English.

This sequence represents the mutated CH2 molecule Gldeltaab, and is a binding molecule of the invention. The recombinant binding molecule is capable of binding a target molecule without triggering complement dependent lysis, or the cell-mediated destruction of the target comprises: (a) a binding domain capable of binding a target molecule; and (b) an effector domain that is homologous to all or part of a constant

Claim 12; Fig 17; 81pp; English.

properties.

```
domain of a human immunoglobulin G (IgG) heavy chain. The binding molecule is used to bind a target molecule (especially FegammaRIIb causing inhibition of B cell activation, mast cell degranulation or phagocytosis). The binding molecule can be used to prevent or inhibit the binding molecule is useful for the treatment of graft-vs-molecule. The binding molecule is useful for the treatment of graft-vs-molecule. The binding molecule is useful for the treatment of graft-vs-molecule. The binding molecule is useful for the treatment of graft-vs-cost disease, organ transplant rejection, bone-marrow transplant rejection, autoimmune hacmolytic anaemia, rejection, autoimmune thrombocytopaenia and arthritis), alloimmunity (e.g. chronic or acute inflammatory diseases (e.g. Crohn's, HD) coronary artery occlusion). The binding molecules do not activate complement or trigger cytotoxic activities through FegammaR and desirable IgG properties have been retained. The polypeptides do not contain nonhuman amino acids, and are therefore likely to have reduced immunogenicity. Further, they still bind Protein A, which is consistent for the being able to cross the human placenta through interaction with FCRn for a properties and the forman and placenta through interaction with FCRn for a properties for the forman and placenta through interaction with FCRn forman and placents through interaction with FCRn format and forman and form
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Binding molecule; CH2 sequence; complement dependent lysis; FogammaRIID; cell-mediated destruction; human; immunoglobulin G; IgG heavy chain; B cell activation; mast cell degranulation; phagocytosis; vasculitis; Crohn's disease; graft-va-host disease; organ transplant rejection; bone-marrow transplant rejection; autoimmune disease; asthma; allergy; alloimmune thrombocytopaenia; arthritis; erythroblastosis foetalis; neonatal alloimmune thrombocytopaenia; Goodpastures disease; therapy; sickle cell anaemia; coronary artery occlusion.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            1 APPVAGPSVFLFPPKPKDTLMISRTPEVTCVVVDVSHEDPEVKFNWYVDGVEVHNAKTKP 60

neonatal Fc receptor)

This sequence represents the mutated CH2 molecule Gldeltaac, and is a binding molecule of the invention. The recombinant binding molecule is capable of binding a target molecule without tringgering complement capable of binding a target molecule without tringgering complement capable of binding domain capable of binding a target molecule; and comprises: (a) a binding domain capable of binding a target molecule; and comparing inhibition of a human immunoglobulin G (IgG) heavy chain. The binding molecule can be used to prevent or inhibit the binding molecule can be used to prevent or inhibit the binding molecule can be used to prevent or inhibit the binding molecule is useful for the treatment of graft-vs. Compresses. The binding molecule, e.g. an antibody, to the target condecule. The binding molecule is useful for the treatment of graft-vs. Complement thrombocytopaenia and arthritis, autoimmune haromolytic anaemia, autoimmunity (e.g. vasculitis, autoimmune haemolytic anaemia, correction, autoimmunity (e.g. vasculitis), alloimmunity (e.g. chronic or acute inflammanch thrombocytopaenia, asthma and allergy), chronic or acute inflammanch thrombocytopaenia, asthma and allergy), chronic or acute inflammanch thrombocytopaenia, asthma and allergy), chronic or acute inflammanch with gomelecules do not activate complement or trigger cytotoxic activities through FogammaR and desirable complement or trigger cytotoxic activities through FogammaR and desirable immunoganicity. Further, they still bind Porcein A, which is consistent immunoganicity Further, they still bind Porcein A, which is consistent immunoganicity. Further, they still bind Porcein A, which is consistent immunoganicity.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ò
                                                                                                                                                                   The sequences given in AAR41707-09 are encoded by the expression vector pAH4625. This vector represents the cloning of the human gamma isotype, gamma-2, with the variable region of the murine monoclonal antibody is 128.1. This plasmid encodes a chimeric monoclonal antibody in which the eavy chain (VH) is derived from a murine source and the sequences encoding CHI. CH2 and CH3 are derived from a human source. This vector, in combination with the chimeric light chain vector, pAG4611 (see also AAQ41845), was transfected into SP2/0 cells and clones were isolated. It is an anti-human transferrin receptor antibody which binds to the transferrin receptor on brain capillary endothelial cells. This antibody may be used in a conjugate in which it is linked to a neuropharmaceutical or diagnostic agent. The conjugate may be used to treat or prevent or diagnostic agent. The conjugate may be used to treat or prevent conversing and Alzhainers disease. It may also be used for diagnostic methods. (Updated on 25-MAR-2003 to correct PN field.)

this sequence represents the mutated characteries, and is a capable of binding a target molecule without triggering complement of capable of binding a target molecule without triggering complement of dependent lysis, or the cell-mediated destruction of the target comprises: (a) a binding domain capable of binding a target molecule; and domain of a human immunoglobulin G (igG) heavy chain. The binding constant of a human immunoglobulin G (igG) heavy chain. The binding constant constant constant causing inhibition of B cell activation, mast cell degranulation or causing inhibition of B cell activation, mast cell degranulation or capagocycasis). The binding molecule, e.g. an antibody, to the target collecule. The binding molecule is useful for the treatment of graft-vs-corpusation or actorimmunity (e.g. autoimmunity (e.g. vascultis, autoimmune haemolytic anaemia, catoimmune thrombocytopaenia and arthritis), alloimmune his corpusation, autoimmunoty diseases (e.g. Crohn's, HDN chorata alloimmune thrombocytopaenia, asthma and allergy), chronic or acute inflammunoty diseases (e.g. Crohn's, HDN corpusation). The binding molecules do not activate complement or trigger cytotoxic activities do not activate complement or trigger cytotoxic activities through for contain nondimunogenicity. Further they still bind Protein A, which is consistent contain mino acids, and are therefore likely to have reduced immunogenicity. Further, they still bind Protein A, which is consistent contain being able to cross the human placenta through interaction with Forn contains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Binding domain; immunoglobulin; fusion protein; cytostatic; antiarthritic; immunosuppressive; antidabetic; antithyroid; mueuroprotective, hinge region; immunoglobulin heavy chain; CH2 constant region; fall constant region; IGG1; antibody dependent cell-mediated cytotoxicity; ADCC; complement fixation; antibody dependent call-mediated cytotoxicity; ADCC; complement fixation; antignin; BCG1; myasthenia gravis; Grave's disease; rheumatoid arthritis; myasthenia gravis; Grave's disease; type I diabetes mellitus; multiple sclerosis; autoimmune disease.
                                                                                                                                              Immunoglobulic-derived binding molecules that do not activate complement or trigger cytotoxic activities and maintaining desirable immunoglobulin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              9

à g g ò 셤 The invention relates to a binding domain-immunoglobulin fusion protein comprising a binding domain polypeptide, an immunoglobulin heavy chain can comprising a binding domain polypeptide, an immunoglobulin heavy chain can constant region polypeptide, an immunoglobulin heavy chain can constant region polypeptide, and an immunoglobulin heavy chain can constant region polypeptide. The can constant region polypeptide comprises: a wild-type human Igdi immunoglobulin hinge region polypeptide, a mutated human Igdi immunoglobulin hinge region polypeptide, a mutated human Igdi immunoglobulin hinge region polypeptide, a mutated human Igdi immunoglobulin hinge region polypeptide derived from (a) having 3 or more cysteine residues, where the first cysteine residues, contains 2 cysteine residues, where the first cysteine residues, contains 10 cysteine residues, manual contains no more than one cysteine residues, manual immunoglobulin hinge region polypeptide contains no more than one cysteine residue, and a mutated human Igdi immunoglobulin hinge region polypeptide contains no cysteine residues, and a mutated human Igdi munoglobulin hinge region polypeptide contains no cysteine residues and a mutated human Igdi munoglobulin hinge region polypeptide contains conception and the polympoptide is capable of at least one immunoglobulin hinge region polypeptide contains no cysteine residues. The binding domain-immunoglobulin fusion protein of construct comprising the polymological activity comprising the binding domain-immunoglobulin fusion protein, a recombinant expression construct composition comprising the binding domain-immunoglobulin fusion protein a resound a carrier, and a carrier, and note of having or suspected of having a malignant condition or a B-cell disorder, e.g. melanoma, carcinoma or sarcoma, rheumatoid arthritis, cubject having or suspected of having a malignant condition or a B-cell disorder, e.g. melanoma, carcinoma or sarcoma, rheumatoid are for this parent fusion protein or a B-cell disorder, e.g. melanoma, New binding domain-immunoglobulin fusion protein, useful for treating a subject having or suspected of having a malignant condition or a B-cell disorder, e.g. melanoma, Grave's disease or autoimmune disease. immunoglobulin fusion protein-associated protein sequence. Note: The sequence data for this patent formed part of the printed specification and is also available in electronic format directly from USPTO at sequence.htmlDocID=20030118592. The authors have not identified the sequences in the printed specification by their SEQ ID number therefore none of the sequences can be explicitly identified. In humans, IgG1 may exist as either of two allotypes at site 1, 2 or 17. The inventor's propose eliminating these allotypes by amino acid changes to agree with the sequences of IgG2, IgG3 and IgG4. None of the allotype sites (1, 2 and 17) are located within the CH2 domain. New "isoallotypes" should be suitable for therapeutic use in all patients. See AAR27678-R27681. (Updated on 25-MAR-2003 to correct PN field.) Humanised antibodies having modified allotypic determinant - useful for matching allotypes in therapy with decreased likelihood of causing undesirable immune responses. 4 VAGPSVFLFPPKPKDTLMISRTPEVTCVVVDVSHEDPEVKFNWYVDGVEVHNAKTKPREE Isoallotype; IgG1 Glm(1,2,17); anti-allotype response; humanised Ab. ; 0 64 QYNSTYRVVSVLTVLHQDWLNGKEYKCKVSNKALPAPIEKTISKAK 109 64 QYNSTYRVVSVLTVLHQDWLNGKEYKCKVSNKGLPSSIEKTISKAK 109 QYNSTYRVVSVLTVLHQDWLNGKEYKCKVSNKALPAPIEKTISKAK 110 Length 110; 3; Indels 93.3%; Score 542; DB 2; 95.3%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ò
                                                                                                                                                                                                                                                                                                                                                                   The sequences given in AAR41682-85 are encoded by the expression vector, pAH4602. This vector contains open reading frames encoding the heavy chain variable region (VH) of the antibody 128-1, an ampidillin resistance gene and a histidine (histidino) selection marker.

Transcription of the VH gene is from the VH promoter of the murine 27.44 gene. The vector also includes a heavy chain immunoglobulin enhancer and the human gammal constant region (CHI). The VH region of 128.1 was classified by polymerase chain reaction and cloned into plasmid pAH4274.

This was achieved by digesting the plasmid and the product with EcoRV and Nhel. The VH gene was inserted in-frame with the human gammal CH region CH at the 3' end of the VH-J region by means of a Nhel site. 128.1 is anti-human transferrin receptor antibody which binds to the transferrin receptor con brain capillary endothelial cells. This antibody may be used in a conjugate in which it is linked to a neuro-pharmaceutical or neurological disorders eg. brain tumours, AIDS, stroke, epilepsy, Parkinsons and Alzheimers disease. It may also be used for diagnostic methods. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      64

The invention relates to a new composition comprises a variant of a parent polypeptide having at least a portion of a Fc region. The variant mediates antibody-dependent cell-mediated cytotoxicity (ADCC) in the presence of effector cells more effectively than the parent polypeptide and comprises at least one amino acid modification at position 280 in the autoimmune diseases. The present sequence represents e.g., sequence of a human immunoglobulin G, 1gG, CH region.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      5 LGGPSVFLFPPKPKDTLMISRTPEVTCVVVDVSHEDPEVKFNWYVDGVEVHNAKTKPREE 64
